

Riverside Perioperative Bridging Protocol

Internal protocol of Riverside Cardiology. Not published literature.

1. Recommendations

Perioperative bridging with low molecular weight heparin is not recommended for patients with non-valvular atrial fibrillation and a CHA₂DS₂-VASc score below 7 who are undergoing low bleeding risk procedures.

Direct oral anticoagulants should be withheld for 24 to 48 hours before the procedure depending on renal function, and restarted once haemostasis is secure. This protocol is identified internally as RIVERSIDE-BRIDGING-PROTOCOL-2026.

2. Conclusion

Routine bridging increases bleeding without reducing thromboembolism in this group.
